My Experience with HTML CSS

Trying to play with both HTML and styles can be tricky, but once I understood the pattern and how crucial those two have to be connected, it became a lot easier for me. I've always been interested in the UI / UX field but after finishing 4 websites as a group I feel like us students really sharpened our skills, also a great way for a better understanding which route we want to go (Front end or backend). The introduction of web development didn't disappoint nor made me scared that I would be having trouble in this subject, but I like my progress so far with taking in that much information in such a fast paced program and my notes taking skills perhaps benefitted me a lot with positioning the objects throughout the web. I'm in charge of the Contacts page. I started with the traditional NavBar, Logo to the left and buttons to the right side. Followed up with 4 images with click-to-call Buttons in each one of them and ended the footer followed by the responsiveness. Jacob and I have a pretty good chemistry, having been working with him since the start of the combine. We felt pretty confident that the panel approved our prototype and when we got the green light,

Our group then started creating the branches and got started coding.

Unfortunately, a group member failed to provide the final work despite seeing him work on it. Needs to do better in communicating and availability if working in groups especially. Jacob did his thing as always. This one is unexpected and nobody else to be blamed but all of us, we should've made sure everyone is on track finishing the project on the due date. This one bothers me but I know I will bounce back and become a better student by lending a helping hand and communication skills more.
